# Recap | Gulp Setup

**Architecture**

```
- yourFolder
        - src
                - js
                        - yourJsFile.js
                - less/sass
                        - yourLessOrSassFile.less/scss
                index.html
        - dist
        gulpfile.js
```

**Step 1**

You need to configure a gulpfile that takes Less or SASS file and turn them into css.
The Less or SASS files should be under the folder /src/less or /src/sass and the css transformed files in /dist/css

**Step 2**

You need to add a task to the gulpfile that takes Javascript file written in ES6 and turn them into ES5 using Babel (or equivalent).
The ES6 files should be under the folder /src/js and the ES5 transformed files in /dist/js

**Step 3**

You need to add a task to the gulpfile that launch a local webserver using Browser-sync (or equivalent) and reload it as soon as a changes appear inside de /src folder
